Research Question Is recreational computer / video game use associated with shorter sleep on average school nights? Variables Outcome: sleep hours (Q97) Predictor: non-school computer/video game hours (Q82) Controls: sex and grade	Mean sleep decreases as screen time rises <table border="1"> <caption>Mean Sleep Hours by Screen Time</caption> <thead> <tr> <th>Screen Time</th> <th>Mean Sleep (h)</th> </tr> </thead> <tbody> <tr><td>0 h</td><td>6.84</td></tr> <tr><td><1 h</td><td>6.89</td></tr> <tr><td>1 h</td><td>6.89</td></tr> <tr><td>2 h</td><td>6.83</td></tr> <tr><td>3 h</td><td>6.71</td></tr> <tr><td>4 h</td><td>6.61</td></tr> <tr><td>5+ h</td><td>6.47</td></tr> </tbody> </table> 8+ hour sleepers are less common at higher screen time <table border="1"> <caption>% Sleeping 8+ Hours by Screen Time</caption> <thead> <tr> <th>Screen Time</th> <th>% Sleeping 8+ h</th> </tr> </thead> <tbody> <tr><td>0 h</td><td>34.6</td></tr> <tr><td><1 h</td><td>33.5</td></tr> <tr><td>1 h</td><td>32.6</td></tr> <tr><td>2 h</td><td>30.8</td></tr> <tr><td>3 h</td><td>26.4</td></tr> <tr><td>4 h</td><td>25.8</td></tr> <tr><td>5+ h</td><td>25.0</td></tr> </tbody> </table>	Screen Time	Mean Sleep (h)	0 h	6.84	<1 h	6.89	1 h	6.89	2 h	6.83	3 h	6.71	4 h	6.61	5+ h	6.47	Screen Time	% Sleeping 8+ h	0 h	34.6	<1 h	33.5	1 h	32.6	2 h	30.8	3 h	26.4	4 h	25.8	5+ h	25.0
Screen Time	Mean Sleep (h)																																
0 h	6.84																																
<1 h	6.89																																
1 h	6.89																																
2 h	6.83																																
3 h	6.71																																
4 h	6.61																																
5+ h	6.47																																
Screen Time	% Sleeping 8+ h																																
0 h	34.6																																
<1 h	33.5																																
1 h	32.6																																
2 h	30.8																																
3 h	26.4																																
4 h	25.8																																
5+ h	25.0																																
Cleaned Sample n = 12,042 Grades 9-12 Missing selected variables removed	Interpretation Students reporting 5+ hours of recreational screen time slept about 22 fewer minutes than students reporting no screen time. The regression estimates about 5.6 fewer minutes of sleep for each additional screen-time hour after adjusting for sex and grade.																																
Methods One-way ANOVA + OLS regression with HC3 robust standard errors. Categories were converted to approximate hours for interpretation.	Conclusion Screen time is statistically associated with sleep duration, but the effect size is small. This supports a cautious conclusion: recreational screen use may relate to shorter sleep, yet other factors also matter.																																

Screen Time and Sleep Among U.S.A High School Students

2007 Youth Risk Behavior Survey (YRBS) | One-page statistical summary
